TECHNOLOGY

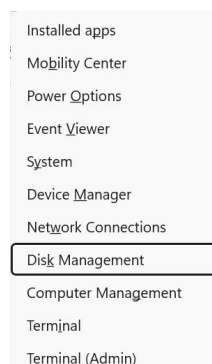

LAB ASSIGNMENT NO 1

- How to build a Virtual Disk File with the VHD File Extension and store the data on this Virtual Disk?

Create a Virtual Hard Disk (VHD or VHDX) using the Disk Management utility in Windows

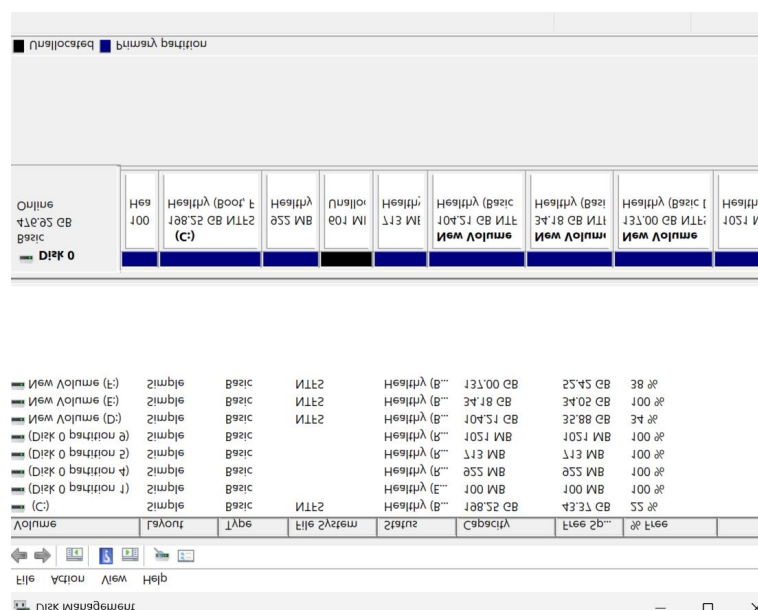

1. Open Disk Management:

- Press the **Windows key + X** and select **Disk Management** from the menu. Alternatively, type (**diskmgmt.msc**) in the Run dialog (Windows key + R) and press Enter.

2. Start the Creation Process:

--In the Disk Management window, go to the **Action** menu and select **Create VHD**

3. Specify Location and Size:

Location: To save the .vhd or .vhdx file on your physical hard drive, click the Browse option, and select the desired location. Enter the appropriate file name (for example, **MyVirtualDisk.vhdx**).

Virtual hard disk size: Specify the size that you require your virtual disk to be. This size must be in MB, GB, or TB.

Virtual hard disk format: Select either VHD (standard virtual hard disk format) or VHDX (better for larger disks and offers more resilience which is preferred).

Virtual hard disk type: Select Completely expanding (grows as you provide more data, to the maximum size you set) or the Fixed size (all space is set right away which forms a small speed gain).

4. Create the VHD:

Click **OK**. The system will create and automatically attach the new virtual disk, which will appear as a new disk in the Disk Management window, marked as "Unknown" and "Not Initialized."

1. Initialize and Format the Virtual Disk:

- **Initialize the Disk:** Right-click on the new disk (the left area with the disk number) and select **Initialize Disk**. Choose **GPT** or **MBR** and click **OK**
- **Create a Volume:** Right-click on the **Un allocated** space and select **New Simple Volume**.
- **Follow the New Simple Volume Wizard**
 1. Specify the volume size.
 2. Assign a drive letter.
 3. Format the volume (File system: **NTFS**; check **Perform a quick format**; assign a **Volume label**).
 4. Click **Finish**.

5. Store Data on the Virtual Disk:

- · Once formatted, the VHD will appear as a new drive in **File Explorer** with the assigned drive letter.

- You can now open this new drive and **copy, move, or save** files and folders to it. The data is now stored inside the single VHD file you created.
